SHADE TREE COMMISSION NEWS

Pruning Trees in Winter and Early Spring

The timing of tree pruning depends on individual species and your goals for the tree. Light pruning and the removal of dead wood can be done anytime. Pruning during dormancy is the most common practice. It results in a vigorous burst of new growth in the spring and should be used if that is the desired effect. It is usually best to wait until the coldest part of winter has passed. Some species, such as maple, walnuts and birches, may "bleed" when the sap begins to flow. This is not harmful and will cease when the tree leafs out.

Keep in mind, if your purpose is to enhance flowering, pruning should be timed as follows:

1. For trees that bloom in spring, prune when their flowers fade.
2. Trees and shrubs that flower in mid- to late summer should be pruned in winter or early spring.

Keys To Good Pruning:

1. Begin visual inspection at the top of the tree and work downward.
2. Use The 1/3 and 1/4 Rules of Pruning
 - a. Do not remove more than 1/4 of a tree's crown in a season.
 - b. Ideally, main side branches should be at least 1/3 smaller than the diameter of the trunk.
 - c. For most deciduous (broadleaf) trees, don't prune up from the bottom any more than 1/3 of the tree's total height.
 - d. Where possible, try to encourage side branches that form angles that are 1/3 off vertical that form "10 o'clock" or "2 o'clock" angles with the trunk.
3. For most species, the tree should have a single trunk. Identify the best leader and lateral branches before you begin pruning and remove defective parts before pruning for form.
4. Do not paint pruning cuts.
5. Keep tools sharp. One-hand pruning shears with curved blades work best on young trees.
6. For high branches use a pole pruner. A major job on a big tree should be done by a professional arborist.
7. For larger branches, cut outside the branch bark and ridge collar (swollen area). Do not leave a protruding stub. If the limb is too small to have formed a collar cut close.
8. When simply shortening a small branch, make the cut at a lateral bud or another lateral branch. Favor a bud that will produce a branch that will grow in desired direction (usually outward). The cut should be sharp and clean and made at a slight angle about 1/4 inch beyond the bud.
